Functions

- void calc_current_reference (MotorParameters *motor, volatile Reference *reference)

  Calculates the current references using a FOC algorithm. It computes the current vector for the MTPA trajectory and limits the current reference to isMaxRef (calculated by derating, starting from the motor's maximum current). The MTPV trajectory is not implemented to save some computation time due to the nature of the motors expected. In order to implement field weakening, an external voltage loop modifying gammaRef is needed and should be called inside here. When implementing field weakening, special attention must be put to the torque reference being near 0 or differing from the speed sign (regeneration). A minimum id current must be set for speeds higher than Vs/lambda. Study thoroughly, simulate first.
- void calc_current_loop (volatile InverterStruct *inv)

Calculates the id-iq loops.

- void saturate_voltage (volatile InverterStruct *inv)

  Saturates PI output to not surpass DC voltage.

- void calc_duties (float vd, float vq, float vDC, float sinTheta_e, float cosTheta_e, volatile Duties *duties)

Calibrate the current sensor offsets.

This function calculates the average offset for each current sensor channel by reading the ADC values when no current is flowing. The calculated offsets are used to correct the sensor readings.

Parameters

in	*rawADC*	Buffer containing the raw ADC values for the channels.
out	*currentOffsets*	Array to store the calculated offsets for each current channel.
in	*numSamples*	Number of samples to average for the offset calculation.

#include <PergaMOD.h>

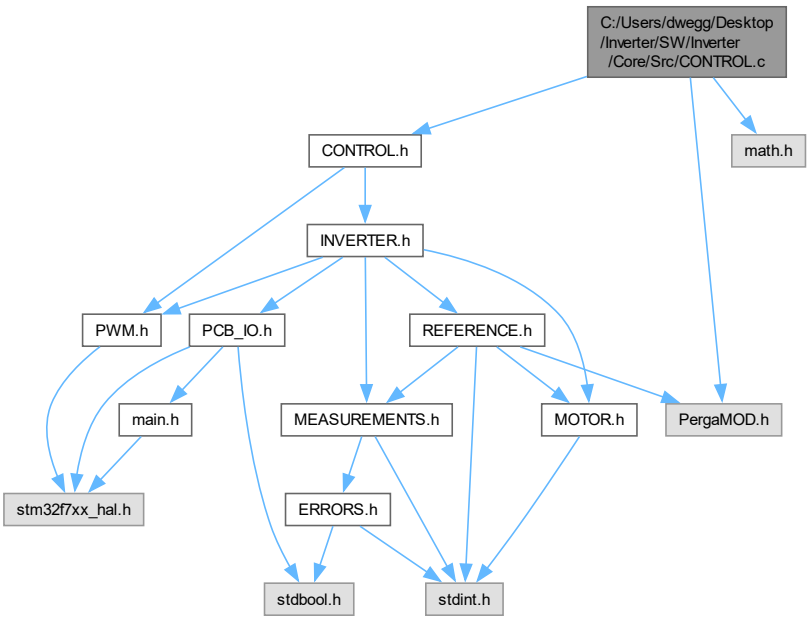
Include dependency graph for CONTROL.c:



Functions

- void calc_current_reference (MotorParameters *motor, volatile Reference *reference)

  Calculates the current references using a FOC algorithm. It computes the current vector for the MTPA trajectory and limits the current reference to isMaxRef (calculated by derating, starting from the motor's maximum current). The MTPV trajectory is not implemented to save some computation time due to the nature of the motors expected. In order to implement field weakening, an external voltage loop modifying gammaRef is needed and should be called inside here. When implementing field weakening, special attention must be put to the torque reference being near 0 or differing from the speed sign (regeneration). A minimum id current must be set for speeds higher than Vs/lambda. Study thoroughly, simulate first.
- void calc_current_loop (volatile InverterStruct *inv)

  Calculates the id-iq loops.
- void saturate_voltage (volatile InverterStruct *inv)

  Saturates PI output to not surpass DC voltage.
- void calc_duties (float vd, float vq, float vDC, float sinTheta_e, float cosTheta_e, volatile Duties *duties)

4.33.2 Function Documentation

4.33.2.1 calibrate_offsets()

```
void calibrate_offsets (
            volatile uint16_t rawADC[],
            volatile float currentOffsets[],
            uint32_t numSamples )
```

Calibrate the current sensor offsets.

This function calculates the average offset for each current sensor channel by reading the ADC values when no current is flowing. The calculated offsets are used to correct the sensor readings.

Parameters

in	*rawADC*	Buffer containing the raw ADC values for the channels.
out	*currentOffsets*	Array to store the calculated offsets for each current channel.
in	*numSamples*	Number of samples to average for the offset calculation.

Here is the caller graph for this function:

4.33.2.2 get_currents_voltage()

```
void get_currents_voltage (
            volatile uint16_t rawADC[],
            volatile Analog * analog,
            volatile Feedback * feedback,
            volatile InverterError * errors,
            float sinTheta_e,
            float cosTheta_e )
```

Get electrical ADC measurements.

Parameters

in	*rawADC*	Pointer to the raw ADC values array.
out	*analog*	Pointer to the ADC struct to store the results.
out	*feedback*	Pointer to the Feedback struct to store id and iq.
in	*sinTheta_e*	Electrical angle sine (-1..1)
in	*cosTheta_e*	Electrical angle cosine (-1..1)

4.33.2.3 get_idiq()

```
void get_idiq (
            float ia,
            float ib,
            float ic,
            float sinTheta_e,
            float cosTheta_e,
            float * idMeas,
            float * iqMeas )
```

Computes d-q currents from current measurements and electrical angle.

This function computes the d-q currents from phase currents (ABC), theta_e, and stores the results in the provided pointers.

Parameters

in	*ia*	Phase A current in A.
in	*ib*	Phase B current in A.
in	*ic*	Phase C current in A.
in	*sinTheta_e*	Electrical angle sine (-1..1)

Parameters

in	*cosTheta_e*	Electrical angle cosine (-1..1)
out	*idMeas*	Pointer to store the D-axis current.
out	*iqMeas*	Pointer to store the Q-axis current.

4.33.2.4 get_linear()

```
float get_linear (
            uint32_t bits,
            float slope,
            float offset )
```

Convert ADC reading to physical measurement with linear response.

Parameters

in	*bits*	The ADC reading.
in	*slope*	The slope (units per volt).
in	*offset*	The offset (volts at zero).

Return values

measurement	The physical measurement.

4.33.2.5 get_temperature()

```
float get_temperature (
            uint32_t bits,
            const float tempLUT[] )
```

Retrieves temperature from a lookup table based on ADC bits.

This function retrieves temperature from a lookup table based on the ADC bits. The lookup table (LUT) must have a value for each possible ADC bit combination.

Parameters

in	*bits*	ADC reading converted to bits.
in	*tempLUT*	Lookup table containing temperature values.

Returns

Temperature corresponding to the provided ADC bits.
